

I am strongly opposed to RM-10355.

Given the many sources for these feeds, especially the Internet, I am uncertain why we need to do this. I am also concerned that this traffic will continue to increase and occupy spectrum for lengthy periods of time -- rendering them unavailable to more appropriate two-way Amateur use.

I would prefer that all such rebroadcasts be moved to non-Amateur frequencies such as FRS, GMRS, or MURS.

Also, since these are one-way broadcasts they are inappropriate to Amateur Radio and may be monitored without the use of two-way equipment (e.g. scanners).

I believe that all one-way "broadcast"-type communications be removed from Amateur spectrum. The Internet is fully capable of hosting such activities and over 80% of all Amateurs have ready access to the Internet. I have seen no successful arguments that Amateur one-way broadcasting is so necessary that it overwhelms the denial of spectrum for two-way Amateur communications on already congested bands.

Respectfully and 73, Doc KD4E
